## Antioxidant Scanner

We would like to remind you of the antioxidant scanner technology we provide which will aid in addressing your eye care, as well as your overall health care needs. Current medical literature indicates that antioxidants can decrease your risk of (and slow the progression of) cataracts, macular degeneration, dementia, cancer, heart disease, and complications related to diabetes. Antioxidants have also been shown to slow down the aging process, boost your immune system, and speed recovery times while decreasing pain and inflammation.

If you are currently taking vitamins, this scanner will show you how well they are working. It will also address how the food you eat in your diet can affect your antioxidant levels. Many physicians across the nation are utilizing this technology, not only for eye conditions, but overall health.

Dr. Korthals and Dr. Pownell recommend their patients get an antioxidant scan as part of their regular eye examination. This scanner score will then be added to their patient records and monitored in the same way that eye pressures, visual acuities, blood pressure, blood sugar or cholesterol levels are used to track a patients overall state of health.

There is a \$20 fee for the scan which is currently not covered by insurance plans because it is so new. The scan is non-invasive, painless and a reading is obtained in just 90 seconds. If your reading is low, we will discuss ways in which you can raise it.

\_\_\_\_\_ Yes, I would like to have this scan done today

\_\_\_\_\_ I prefer to wait on the scan at this time
